Model TS-670

FM-430, GC-10, VS-1

ALL MODE QUAD BANDER

CONTENTS

TS-670

SPECIFICATIONS

[General]

Transmit/receive frequency range:
40 m band: 7.0 — 7.1 MHz
15 m band: 21.0 — 21.45 MHz
10 m band: 28.0 — 29.7 MHz
6 m band: 50.0 — 54.0 MHz

Mode:
SSB (A3J), CW (A1), AM (A3) and FM (F3-option)
(50 MHz band only for AM transmission.)

Antenna impedance: 50 Ω

Supply voltage: 12 — 16 V DC
(Reference voltage: 13.8 V DC)

Power consumption:
Approx. 4 A at transmission
Approx. 1.1 A at reception with no signal

Dimensions: 270W(279)×96H(108)×260D(298) mm
Dimensions in ( ) are the maximum, including projections.

Weight: 5.4 kg

[Transmitter]

Final power input: SSB, CW, FM 10 W
AM 4 W
(50 MHz band only)

Modulation :
SSB: Balanced modulation
FM : Variable reactance direct shift
AM : Low level modulation

Carrier suppression: Better than 40 dB

Unwanted sideband suppression: Better than 50 dB

Unwanted radiation intensity:
7, 21, 28 MHz bands : Less than −40 dB
50 MHz band : Less than −60 dB
21 MHz band 5th higher harmonic: Less than −70 dB
50 MHz band 2nd higher harmonic: Less than −70 dB

Transmission frequency response (SSB): 400 — 2600 Hz
(better than −6 dB)

Maximum frequency deviation (FM): ±5 kHz
(FM-430 installed)

Microphone impedance: 500 Ω — 50 kΩ

[Receiver]

Circuitry: SSB, CW, AM : Single superheterodyne
: Double superheterodyne

Intermediate frequency: SSB, CW, AM: 8.83 MHz
FM: 1st IF 8.83 MHz
: 2nd IF 455 kHz

Sensitivity:
SSB, CW (10 dB S/N) : Less than −12 dBμ (0.25 μV)
AM (10 dB S/N) : Less than 6 dBμ (2 μV)
FM (30 dB S/N) : Less than 0 dBμ (1 μV)
(12 dB SINAD) : Less than −8 dBμ (0.4 μV)
With YK-88A inserted in AM mode.
With FM-430 inserted in FM mode.

Squelch sensitivity:
FM (28.50 MHz band) : Less than −10 dBμ (0.32 μV)
SSB, CW, AM : Less than 10 dBμ (3.2 μV)

Image ratio: More than 50 dB

IF reflection: More than 50 dB

Selectivity:

	−6	−60 dB
SSB, CW	2.5 kHz	6 kHz
AM*	6 kHz	11 kHz
FM**	12 kHz	22 kHz

* With YK-88A inserted.
** With FM-430 inserted.

RIT variable range: More than ±1.2 kHz

Audio output power: More than 1.5 W
(with 8 Ω load, 10% distortion)

Audio output impedance: 8 — 16 Ω

[Frequency Controller]

Frequency accuracy:
Within $\pm 10 \times 10^{-6}$ at room temperature
Within $\pm 30 \times 10^{-6}$ at 0°C — +50°C

Frequency stability (at reception):
Within $\pm 30 \times 10^{-6}$ at 0°C — +50°C.
Within ±300 Hz for up to 60 minutes after turn-on, and within 30 Hz for any 30 minute period thereafter.

■ Circuitry and ratings are subject to change without notice due to developments in technology.

■ GC-10, VS-1, VOX-4, FM-430, MB-430, SP-430 and PS-20 are optionally available.

CIRCUIT DESCRIPTION

OUTLINE

The TS-670 is a single conversion 4-band transceiver having an intermediate frequency of 8.83 MHz. In the FM reception mode double conversion at 455 KHz is employed.

The Phase Locked Loop (PLL) uses a digital variable frequency oscillator (VFO) control system at a 10 and 100 Hz step switching rate in all modes but FM, in which 10 KHz and 100 KHz switching is automatically selected by the transceivers microprocessor. Excluding only the FM receiver second conversion oscillator, all oscillator frequencies generated in this device are including the carrier injection frequencies controlled by and synthesized from a single reference frequency source of 24 MHz.

The main auxiliary functions include two VFOs, 80-channel memory, frequency specify function, memory scan, program scan, IF shift, RIT, NB, power control and other useful functions.

RECEPTION CIRCUIT CONFIGURATION

The TS-670 reception system uses a single conversion at IF 8.83 MHz in SSB, CW and AM modes. In the FM mode, double conversion is used with a second IF at 455 kHz.

The RF stage is divided into 50 MHz, 7 MHz, 21 MHz and 28 MHz, while the stage following the mixer is common.

The signal received by the antenna is fed through the Low Pass Filter (LPF) (common for both transmission and reception), which is relay switched according to band, and antenna relay RL1 on the Filter unit before being input to the RF unit PA terminal.

The signal is fed through broad-band transformer T1, RF attenuating relay RL2, 8.83 MHz trap T2 and T3, IF traps L2 to L4, and for 50 MHz Band, the signal is stepped up by antenna coil T4 and T5. It is then amplified by RF amp Q1 (2SK74 (L)) and fed through Band Pass Filter (BPF) T6 to T8 before being output from buffer amp Q2. HF signals are stepped up by broadband transformer T9, and then fed through either a 7, 21, or 28 MHz BPF : 7 MHz; T12, T15 and T18. 21 MHz; T11, T14 and T17. 28 MHz; T10, T13 and T16. It is then amplified by RF amp Q3 (3SK74 (L)) before being output from buffer amp Q4.

Both 50 MHz and HF signals are converted a balanced signal by broad-band transformer T20, then mixed with the local oscillator by common mixers Q5 and Q6 (3SK122(L) x 2) to become an 8.83 MHz intermediate frequency signal T19 is an 8.83 MHz trap.

This signal is fed through ceramic filter CF1, then amplified by the first IF amp Q7 (3SK73 GR), and fed through Noise Blanker (NB) gate diode D17 through D20 before being output to the IF unit via the RIF terminal in the SSB, CW and AM modes. In the FM mode, the signal is first fed through buffer amp Q8, and is then output to the FM unit through the FMI terminal. The noise blanker samples from the output of ceramic filter CF1, feeds this through buffer amp Q11 (2SK192 (Y)), then amplifies this by Q12, Q13 and Q14 the noise component is detected by diodes D23 and D24 before driving switching transistor Q15 to switch the NB gate.

The NB gate also serves as a blanking circuit to eliminate Phase Locked Loop (PLL) "click" noise when the Voltage Controled Oscillator (VCO) resets (Q9 and Q10).

The signal from the RF unit RIF terminal is fed to the IF unit RIF terminal through matching transformer L1 and through mode-selected Monolithic Crystal Filters (MCFs), and is then amplified by IF amps Q1 and Q4 (3SK73).

The signal in SSB and CW modes is detected by product detector D26 through D29 (1N60), amplified by audio pre-amp Q7 which is common to each mode, and fed through squelch switching transistor Q8 before being output to the gain control.

In the FM mode, the signal is detected by diode D25, then passed through buffer amp Q6 before being fed to pre-amp Q7.

In FM mode, the signal is mixed, amplified and detected in the FM unit, then fed through the IF unit FAF terminal before being input to pre-amp Q7.

The audio input to this pre-amplifier is switched by either D30, for the SSB and CW modes, D32 for the AM mode or D31 for the FM mode.

TRANSMISSION CIRCUIT CONFIGURATION

Like the reception system, the transmission system uses single conversion in the SSB, CW and AM modes, and uses double conversion in the FM mode.

In the SSB, CW and AM modes, audio from the MIC input terminal is amplified by Q34 on the IF unit, then fed through the mic gain control, and further amplified by Q35 before being input to balanced modulator Q36 (AN612).

In the SSB mode, the output from this modulator is Double Side Band, and after passing through the Monolithic Crystal Filter (MCF) YK-88S3 becomes an SSB signal.

In the AM and CW modes, modulator balance is lost by applying the DC voltage to pin 1 of this modulator. At this time, the amount of carrier to be injected is determined by varying the DC bias current to pin diode D44 (MI204). In the AM mode, the output from Q36 is fed through R5 (680 ohm). (However, when AM filter YK-88A is mounted, the signal is also fed through this filter.) In the CW mode, the output is fed through SSB filter YK-88S3. Each mode signal fed through the filter is amplified by transmitter IF amp Q24, then output to the RF unit.

In the FM mode, the audio signal fed through mic amp Q34 which is commonly used is fed to the FM unit where the signal is FM-modulated using the 8831.5 kHz carrier frequency, the out-put of which is input to No. 1 transmitter balanced mixers Q24 and Q25 (3SK122 x 2) of the RF unit.

The switching between the SSB, CW, AM signals and the FM signal is performed by switching diodes D32 and D38.

The ALC (Automatic Level Control) is performed on transmitter IF amp Q42 of the IF unit.

The transmitter signal from the IF unit is mixed with bandwise VCO output at first transmitter balanced mixers Q24 and

TS-670

CIRCUIT DESCRIPTION

Q25, then branched into two signals; 50 MHz and 7, 21, 28 MHz signals. The 50 MHz signal is fed through BPF (T37 to T40), then amplified by transmitter amp Q29 (3SK73) and broad-band amplifiers Q30 and Q31 (2SC2086 x 2), and output as a 50 MHz signal. The 7, 21 and 28 MHz signals are fed through each band-wise BPF (common as in reception), then amplified by broad-band amp Q26 (3SK73), buffer amp Q27 and broad-band amp Q28 (2SC2086).

The amplified 50 MHz signal and 7, 21 and 28 MHz signals are switched by relay RL1, then become a drive output to the final unit.

The signal fed to the final unit is amplified by broad-band push-pull drive amps Q1 and Q2 (2SC1971 x 2), then further amplified by broad-band push-pull final amps Q3 and Q4 (2SC2509 x 2), and becomes a 10 W output. The RF output is fed through the band-wise LPFs in the filter unit, then fed to the antenna for output. The ALC and protection detection are performed at the antenna line after feeding through LPFs.

CIRCUIT DESCRIPTION

PLL CIRCUIT

The PLL circuit of the TS-670 consists of 3 PLL circuits using a reference frequency of 24 MHz and all the frequencies are placed under the control of the 24 MHz reference oscillator. ICs 3, 4 and 13 are PLL ICs. A single package of these ICs (MN6147) contains the program divider, phase comparator, and frequency dividers for the reference signal.

The IC3 PLL has a reference comparison frequency of 2 kHz, and oscillates at 116 MHz (120 MHz during AM reception and FM reception). The 9 MHz signal obtained by dividing a 18 MHz signal by 2, the 3rd higher harmonic of 6 MHz which has been produced from a reference frequency of 24 MHz by dividing with 4, is further divided within the PLL to produce 2 kHz, which is in turn used as a reference comparison frequency. Frequency dividing ratios L are 58150 in USB, 57850 in LSB and 58070 in CW (during transmission) and 60150 during FM and AM (reception). The frequency dividing ratios are determined by the signals fed from data bus DB0 to DB3 of the CPU (IC19: TMP8049P-3034).

The 116 MHz (AM reception, FM 120 MHz) output is divided by a ratio 1/100 x 1/2 (IC5: M54459L, IC6-b: SN74LS112AN) to become 0.5815 MHz (0.6 MHz AM reception, FM) in USB mode, then mixed with a 2.5 MHz signal produced from the reference oscillator by MIX5 (IC7: SN161913P), fed through the BPF, and then mixed with the 6 MHz signal produced by the reference oscillator to obtain 8.8315 MHz in USB mode. This signal is fed through the buffer amp to become the CAR signal, and, on the other hand, it becomes a signal for other PLL. PLL IC4 has a reference comparison frequency of 2 kHz and oscillates at 90 to 80 MHz (AM reception, FM 94 to 84 MHz) in 2 kHz steps.

The 9 MHz signal obtained by the reference frequency is divided within the IC to produce a 2 kHz signal which is in turn used as a reference comparison frequency. The frequency dividing ratio M of the program divider is 45000 to 40001 and the frequency dividing setting signals for the IC are sent from data bus B0 to B3 of the CPU (IC19: TMP8049P-3034).

An output of 90 to 80 MHz (AM reception; FM 94 to 84 MHz) from VCO2 (Q24: 2SC1923) is divided by 1/100 x 1/2 (IC9: M54459L, IC6-a: SN74LS112AN) to become a 10 Hz step signal of 450 - 400 kHz (AM reception; FM 470 to 420 kHz). This signal is mixed with the 8.83 MHz PLL output of IC3 at MIX3 (IC10: SN16913P), then the resultant 8.38 to 8.43 MHz signal is fed through the ceramic filter and input to MIX2 (IC11: SN16913). This 8.38 to 8.43 MHz signal is either kept as it is or mixed with 48 MHz, 24 MHz, 6 MHz or 18 MHz signals generated by the reference oscillator, then input to the final PLL (IC13).

The final PLL IC13 oscillates at VCO frequencies (7, 21, 28 and 50 MHz amateur band frequencies plus 8.83 MHz) corresponding to respective amateur bands using a reference comparison frequency of 50 kHz. A reference comparison frequency of 50 kHz is obtained by dividing the 9 MHz signal generated from a reference frequency of 24 MHz within the PLL IC. Frequency dividing ratio N of the program divider is 31 to 151, and the frequency dividing ratio is given by data bus B0 to B3 of the CPU (IC19: TMP8049P-3034).

		BAND	Frequency range	VCO (f_1)	(f_2)	(f_4)	(f_5)

*	⑩	50A	50 ~ 54 MHz	58.83 ~ 62.83MHz	2.45 ~ 6.4MHz	56.38 ~ 56.43MHz	48MHz

Note 1: * Mark, original installed (without GC-10)

Note 2: ⑤ Band has change VCO (f_1) only and RF has 8 ~ 12 MHz BPF.

CIRCUIT DESCRIPTION

The VCO consists of Q17, Q18, Q19 and Q20, and the VCO frequencies corresponding to 7, 21, 28 and 50 MHz are mixed with either one of the five corresponding frequencies 14.38 - 14.43 MHz, 32.38 - 32.43 MHz, 56.38 - 56.43 MHz, and 26.38 - 26.43 MHz (8.38 - 8.43 MHz is used when the general coverage unit is incorporated) generated by the previous MIX2, then fed through the BPF and input to the PLL IC where phase is compared with the 50 kHz signal obtained by using dividing ratio N of 31 to 151.

When the optional general coverage unit (GC-10) is incorporated, the outputs from the six VCOs within the GC-10 are fed to MIX1 where phase is compared with the 50 kHz signal just as in amateur bands.

CIRCUIT DESCRIPTION

DIGITAL CONTROL CIRCUIT

The controller of the TS-670 uses two 8-bit microprocessors (μPD8049HC-092, and TMP8049P-3034), and its peripheral circuits consist of three I/O expander ICs (μPD8243C), externally connected RAM (μPD444C), etc.

The two CPUs are connected with each other via 4-bit data bus and 2-bit control bus for data interchange.

The microprocessor clock operates at 8.1 MHz, which is oscillated by CPU-S (IC19). The clock pulse is also fed to the other CPU-M (IC16).

The CPU-M (IC16) performs decision and arithmetic operations with which to select the operating state of the unit, using the data from various switches on the panel and encoders, etc., determining the operating frequencies and modes. The determined frequencies and mode data are stored in the externally connected RAM (IC18) and at the same time transferred to the CPU-S (IC19).

To the CPU-M, the I/O expander IC17 is connected, from which control signals for various indicators are output and to which data from the keyboard switches on the front panel is input in matrixed form.

The CPU-S provides the digital frequency display based on the input frequency and mode data, and calculates frequency dividing ratio for each PLL circuit, then set data at PLL ICs (IC3, IC4 and IC13). At the same time, in order to control the external circuits, the CPU-S also outputs mode data and band data. The band data is output in 5-bit data consisting of 4-bit BCD and 1 bit. The 4-bit BCD data is fed through IC22 (SN74LS145N) where it is divided into 10 bands, and a total of 11-band data is output.

The encoder input circuit consists of the OR, exclusive NOR and NAND gates of IC23, IC24 and IC25; the input 250 pulses/revolution clock rate is multiplied by 4 to become 1000 pulses. The IC25 (TC4011BP) flip-flop circuit detects the direction of revolution of the rotary encoder.

The non-stable multivibrator IC26 (TC4011BP) is an oscillatory circuit for frequency shift by the mic UP/DOWN switch and operates at approx. 55 Hz; this oscillatory frequency determines the shift speed. However, a 1-step feed has nothing to do with this oscillator but is internally processed by the microprocessor.

The RIT and IF shift of the TS-670 are varied by using potentiometers; these can be varied digitally in 10 Hz steps. In RIT mode, the actual frequency is also displayed. The DC voltages preset by potentiometers are divided into approx. 0 to 2.5 V by voltage dividers, then input to the A/D converter (IC15: MB4052) where the signals are converted into the 8-bit (256 steps) data before being input to the CPU-S, varying the frequency dividing ratio of the PLL circuit for control.

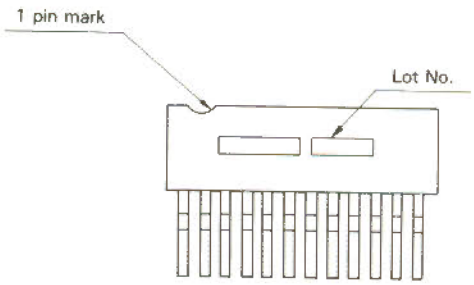
TC4071BP Max rating

Item	Symbol	Rating	Unit
Operating voltage	V_{DD}	$V_{SS}-0.5 \sim V_{SS}+20$	V
Input voltage	V_{IN}	$V_{SS}-0.5 \sim V_{DD}+0.5$	V
Output voltage	V_{OUT}	$V_{SS}-0.5 \sim V_{DD}+0.5$	V
Input current	I_{IN}	±10	mA
Packaged loss	P_D	300	mW
Operating temperature	Tstg	−65 ~ 150	°C
Soldering time, temperature	Tsol.	260°C·10sec	

TC4071BP Block diagram

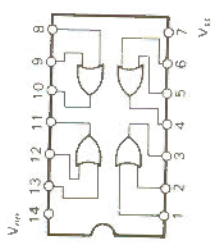


TA57 Max rating (Ta = 25°C)

Item	Symbol	Rating
Collector-Base voltage	V_{CBO}	−75V
Collector-Emitter voltage	V_{CER}	−75V*
Emitter-Base voltage	V_{EBO}	−5V
Collector current	I_C	−50mA
Collector loss	P_C	50mW/element
Junction temperature	Tj	125°C
Operating temperature	Tstg	−55 ~ 125°C

*R_{BE} = 10kΩ

TA57 Terminal diagram



CAPACITORS

CC 45 TH 1H 220 J
1 2 3 4 5 6

1 = Type ..... ceramic electrolytic etc
2 = Shape ..... round square etc
3 = Temp coefficient
4 = Voltage rating
5 = Value
6 = Tolerance

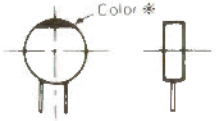
● Temperature coefficient

1st Word	C	L	P	R	S	T	U
Color ※	Black	Red	Orange	Yellow	Green	Blue	Violet
ppm/°C	0	−80	−150	−220	330	−470	−750

2nd Word	G	H	J	K	L
ppm/°C	±30	±60	±120	±250	±500

Example CC45TH = −470 ±60 ppm/°C

CC45



● Tolerance

Code	C	D	G	J	K	M	X	Z	P	No code
(%)	±0.25	±0.5	±2	±5	±10	±20	+40 20	+80 −20	+100 −0	More than 10μF −10 ~ +50 Less than 4.7μF −10 ~ +75

Less than 10 pF

Code	B	C	D	F	G
(pF)	±0.1	±0.25	±0.5	±1	±2

Abbreviation		Abbreviation	
Cap	Capacitor	ML	Mylar
C	Ceramic	S	Styren
E	Electrolytic	T	Tantalum
MC	Mica		

Resistors not listed in this parts list are standard, fixed carbon composition, 1/4W or 1/8W
The resistance values, in ohms, are indicated on the schematic diagram

● Rating voltage

1st word \ 2nd word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	–
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	–
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	

● Capacitor value

1 0 3 = 0.01μF

0 1 0 = 1pF

1 0 0 = 10pF

1 0 1 = 100pF

1 0 2 = 1000pF = 0.001μF

2 2 0 = 22pF
1st number | Multiplier
2nd number

Symbol	Destination
K	U.S.A.
W	Europe
T	Britain
M	General market

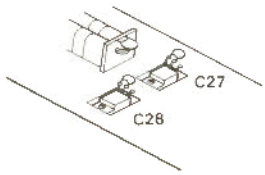
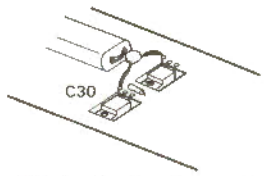
C11 Attachment method





1 Cut wire short as possible on C11
2 Bend C11 as shown left after solder confirm not over edge.

C27 and C28 should be installed as shown above.
Do not install them as indicated in the PC board with silk printed pattern.

C30 should be installed externally and directly as shown above

(Cover the C30 leads with ilux tubes (212-1019-05); the leads length should be minimum.)

ADJUSTMENT

REQUIRED TEST EQUIPMENT

1. DC Voltmeter
1) Input resistance: More than 1 MΩ
2) Voltage range: 1.5 to 1000 V AC/DC

NOTE: A high-precision multimeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

2. DC Ammeter
1) Current range: 150 mA, 500 mA, 2 A, 10 A, High-precision ammeter may be used.

3. RF VTVM
1) Input impedance: 1 MΩ and less than 3 pF, min.
2) Voltage range: 10 mV to 300 V
3) Frequency range: 10 kHz ~ 100 MHz or greater

4. AF Voltmeter
1) Frequency range: 50 Hz to 10 kHz
2) Input resistance: 1 MΩ or greater
3) Voltage range: 10 mV to 30 V

5. AF Generator (AG)
1) Frequency range: 200 Hz to 5 kHz
2) Output: 1 mV or less ~1 V, low distortion

6. AF Dummy Load
1) Impedance: 8 Ω
2) Dissipation: 3 W or greater

7. Oscilloscope
Requires high sensitivity, and external synchroniszation capability.

8. Sweep Generator
1) Center frequency: 5 MHz ~ 60 MHz
2) Frequency deviation: Maximum ± 16 MHz
3) Output voltage:0.1 V or greater
4) Sweep rate: At least 0.5 sec/cm

9. Standard Signal Generator (SSG)
1) Frequency range: 8 to 60 MHz
2) Output: −20 dB/0.1 μV ~ 120 dB/1 V
3) Output impedance: 50 Ω
4) AM and FM modulation can be possible.

NOTE: Generator must be frequency stable.

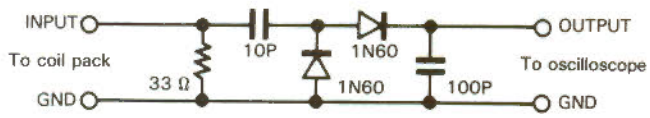
10. Frequency Counter
1) Minimum input voltage: 50 mV
2) Frequency range: 60 MHz or greater

11. Noise Generator
Must generate ignition noise containing harmonics beyond 60 MHz.

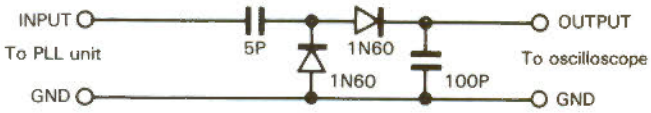
12. Power Meter
1) Impedance: 50 Ω
2) Dissipation: 15 W continuous or greater
3) Frequency limits: 60 MHz or greater

13. Spectrum Analyzer
1) Frequency range: 100 K to 110 MHz or greater
2) Bandwidth: 1 kHz to 3 MHz

14. Detector
1) For adjustment of TX BPF



2) For adjustment of PLL BPF



15. Directional Coupler

16. Power supply
13.8 V DC. Min 4 A

TS-670

OPTION (GC-10)

GC-10 CIRCUIT DESCRIPTION

The GC-10 is an optional unit to be attached to the TS-670 to permit reception of 0.5 to 30 MHz (excluding certain frequencies).

The GC-10 consists of RF amp and 6 sets of BPFs, and six VCOs.

The RF signal is fed from the TS-670 via the RF attenuator, then each band is selected by switching diodes D1 to D12 (IS2588) and amplified by RF amp Q1 (3SK74), then fed through buffer amp Q2 before being input to the reception mixer of the TS-670.

Excluding the 0.5 to 1.8 MHz band, the medium frequency trap for other bands is inserted at the input.

The VCO output for each band is fed through buffer amps Q3 and Q4, then output to the reception mixer of the TS-670.

D31 is a circuit which permits the control unit to detect that the GC-10 is attached to the TS-670.

ADJUSTMENT

Item	Condition	Measurement				Adjustment		Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. VCO adjustment	Voltage adjustment MODE: FM	DC VM	GC	CV	GC				
	0.500MHz					L34		6.0V	
	1.790MHz							1.8 ~ 2.8V	Confirm
	3.990MHz					L36		6.5V	
	1.800MHz							1.8V ±0.5V	Confirm
	6.590MHz					L38		6.5V	
	4.000MHz							1.9V ±0.5V	Confirm
	11.990MHz					L40		6.5V	
	8.000MHz							1.7V ±0.5V	Confirm
	9.900MHz							2V ±0.5V	
	11.990MHz							5.7V ±0.5V	Confirm
	12.000MHz					L43		6.5V	
	15.990MHz							1.5V ±0.5V	Confirm
	16.000MHz					L45		6.5V	
	20.990MHz							1 ~ 1.9V	Confirm
2. RX BPF adjustment	(1) Display: 1MHz (0.5 ~ 1.799MHz) MODE: FM • Connect the sweep output to RF U 2 connector. • Connect the detector to the RF U D3 cathode.	SWEEP SCOPE DETECTOR	RF	D3 (cathode)	GC	L5,6,7	Adjust as shown on the right. 		
	(2) Display: 2MHz (1.8 ~ 3.999MHz)					L8,9,10			
	(3) Display: 5MHz (4 ~ 6.599MHz)					L11,12 13			

OPTION (GC-10)

ADJUSTMENT

Item	Condition	Measurement				Adjustment		Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
3. RX BPF adjustment	(4) Display: 10MHz (8 ~ 11.999MHz)	SWEEP SCOPE DETECTOR	RF	D3 (cathode)	GC	L14,15 16			
	(5) Display: 14MHz (12 ~ 15.999MHz)					L17,18 19			
	(6) Display: 18MHz (16 ~ 20.999MHz)					L20,21 22			

GC-10 SPECIFICATIONS

- **Reception frequency range** : 500 kHz ~ 30 MHz
  (Except around 8.83MHz)
- **Image ratio** : 40 dB or more*
- **IF disturbance ratio** : 40 dB or more*
  * Except 7.0 ~ 7.1 MHz, 21.0 ~ 21.45MHz and 28 ~ 29.7 MHz
- **Sensitivity**

Frequency \ Mode	SSB, CW (10 dB S/N)	AM (10 dB S/N)
0.5 ~ 1.8MHz	6 dBμ (2μV) or less	24 dBμ (16μV) or less
1.8 ~ 7MHz	−6 dBμ (0.5μV) or less	12 dBμ (4μV) or less
*7 ~ 7.1MHz	−12 dBμ (0.25μV) or less	6 dBμ (2μV) or less
7.1 ~ 8.3MHz	−6 dBμ (0.5μV) or less	12 dBμ (4μV) or less
9.5 ~ 21MHz	−6 dBμ (0.5μV) or less	12 dBμ (4μV) or less
*21 ~ 21.45MHz	−12 dBμ (0.25μV) or less	6 dBμ (2μV) or less
21.45 ~ 23MHz	−6 dBμ (0.5μV) or less	12 dBμ (4μV) or less
23 ~ 24.8MHz	4 dBμ (1 6μV) or less	22 dBμ (12.5μV) or less
*24.8 ~ 28MHz	−6 dBμ (0.5μ) or less	12 dBμ (4μV) or less
28 ~ 29.7MHz	−12 dBμ (0.25μV) or less	6 dBμ (2μV) or less
29.7 ~ 30MHz	−6 dBμ (0.5μV) or less	12 dBμ (4μV) or less

* TS-670

- **Dimensions** : 71 mm width
  23 mm height
  135 mm depth
- **Weight** : Approx. 100 g

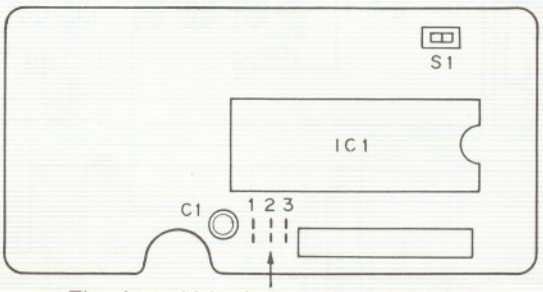
TALK SPEED SELECTION

Speed is factory set at "standard" talk speed. Three different speeds can be selected.

Note: When placing the jumper, solder carefully.

Jumper place \ Speed	Std. speed	30% more than Std.	60% more than Std.
1	X	X	○
2	X	X	○
3	X	○	X

Symbol ○, denotes the place in which a jumper wire is placed.



The place which a jumper wire to be placed.
